

Dev Log #2: Week of September 27th

General description:

This week began with looking at the general structure of what the app will look like. Certain technologies we would be using to support this structure and choose a role for development of the app.

What was completed?

We choose to split the app into 4 sections where each member would take on one of these sections for the majority of the semester. So, I took on the role of working on the front-end system of the app, Brad would be working on the database, Jon the server and Vish the ui

Goals for next week:

- Understand how to incorporate firebase into an android app
- Create a basic chat interface
- Learn how to use github and android studio
- Learn how to use volley
